NETWORKING & SYSTEM ADMINISTRATION LAB (20MCA136)

LAB RECORD

Submitted in partial fulfilment of the requirements for the award of the degree of Master of Computer Applications of A P J Abdul Kalam Technological University, Kerala.

Submitted by:

MERIN BABU (SJC23MCA-2042)

MASTER OF COMPUTER APPLICATIONS ST.JOSEPH'S COLLEGE OF ENGINEERING AND TECHNOLOGY, PALAI CHOONDACHERRY P.O, KOTTAYAM KERALA

May 2024

ST. JOSEPH'S COLLEGE OF ENGINEERING AND TECHNOLOGY, PALAI

(An ISO 9001: 2015 Certified College)

CHOONDACHERRY P.O, KOTTAYAM, KERALA

CERTIFICATE

This is to certify that the Networking & System Administration Lab Record (20MCA136) submitted by **Merin Babu**, student of **Second** semester **MCA** at **ST. JOSEPH'S COLLEGE OF ENGINEERING AND TECHNOLOGY**, **PALAI** in partial fulfilment for the award of Master of Computer Applications is a bonafide record of the lab work carried out by him under our guidance and supervision. This record in any form has not been submitted to any other University or Institute for any purpose.

Dr. Rahul Shajan Associate Professor (Head, Department of Computer Application)

DECLARATION

I Merin Babu, do hereby declare that the Networking & System Administration Lab Record (20MCA136) is a record of work carried out under the guidance of Mr. Anish Augustine K, Asst. Professor, Department of Computer Applications, SJCET, Palai as per the requirement of the curriculum of Master of Computer Applications Programme of A P J Abdul Kalam Technology University, Thiruvananthapuram. Further, I also declare that this record has not been submitted, full or part thereof, in any University / Institution for the award of any Degree / Diploma.

Place: Choondacherry MERIN BABU

Date: (SJC23MCA-2042)

DEPARTMENT OF COMPUTER APPLICATIONS

VISION

To emerge as a center of excellence in the field of computer education with distinct identity and quality in all areas of its activities and develop a new generation of computer professionals with proper leadership, commitment and moral values.

MISSION

- Provide quality education in Computer Applications and bridge the gap between the academia and industry.
- Promoting innovation research and leadership in areas relevant to the socio economic progress of the country.
- Develop intellectual curiosity and a commitment to lifelong learning in students, with societal and environmental concerns.

COURSE OUTCOMES

After the completion of the course 20MCA136 Networking & System Administration Lab the student will be able to:

CO 1	Install and configure common operating systems.	K3 (Apply)
CO 2	Perform system administration tasks.	K3 (Apply)
CO 3	Install and manage servers for web applications.	K2 (Understand)
CO 4	Write shell scripts required for system administration.	K3 (Apply)
CO 5	Acquire skill sets required for a DevOps.	K3 (Apply)

	Shell program to find the sum of odd and even	
4.2	numbers from a set of numbers	34
4.2	Shell program to find the roots of a quadratic	25
4.3	equation	35
4.4	Shell program to generate prime numbers between 1 and 50	37
4.5	Shell program to find the sum of digits of a number using function	43
110	Shell program to print the reverse of a number	13
4.6	using function	44
	Shell script, which receives two filenames as	
	arguments. It checks whether the two files contents are same or not. If they are same then	
4.7	second file is deleted.	47
	Shell script to check executable rights for all	
	files in the current directory, if a file does not	
4.8	have the execute permission then make it executable	50
4.8	executable	50
4.9	Shell program to create Pascal's triangle	53
	Shell script to find out the unique words in a file	
4 10	and also count the occurrence of each of these	55
4.10	words File system hierarchy in a common Linux	55
5	File system hierarchy in a common Linux distribution	60

	Installation and configuration of LAMP stack.	
	Deploy in an open source application such as	
6	phpmyadmin and WordPress.	65
	Build and install software from source code,	
	familiarity with make and cmake utilities	
7	expected	73
	Introduction to command line tools for	
	networking IPv4 networking, network	
8	commands	75
	Analyzing network packet stream using	
9	topdump and Wireshark	78
	Introduction to Hypervisors and VMs, Xen or	
	KVM	
	Introduction to Containers: Docker, installation	
10	and deployment	81
	Installing and configuring modern frameworks	
11	like Laravel	85

1. Introduction to Computer hardware: Physical identification of major components of a computer system such as mother board, RAM modules, daughter cards, bus slots, SMPS, internal storage devices, interfacing ports.

Procedure:

What is Computer Hardware?

Computer hardware is a hardware part of a computer system. In simple words, only those parts of the computer system which we can see or touch are called computer hardware.

Hardware is an important part of our computer system without which the computer is incomplete. You cannot use a computer without hardware and without hardware, there cannot be a computer system or construction.

1. Mouse

A mouse is a hardware input device that is used to move the cursor or pointer on computer screens. It can also be used to run computer programs, select items in a graphical user interface, and manipulate objects in the computer world. Some common examples of how it can be used are clicking on buttons, scrolling up and down the screen, selecting files, opening folders, and so on.

2. Keyboard

A keyboard is an input device that you use to enter data into a computer. It's also called the input device for your computer. Keyboards are used with PCs, laptops, tablets, and other devices. There are many different types of keyboards, but the most common one is the QWERTY keyboard. A QWERTY keyboard has all the letters in alphabetical order on it. This is different from some other types of keyboards, like Dvorak or Colemak keyboards. For example, these keyboards have keys arranged differently than what you're used to seeing on a QWERTY keyboard. And that means that typing on these keyboards will feel like typing in another language at first! But don't worry once you get accustomed to it, it feels natural!

3. Monitor

Personal computers use a monitor to display data, run the software, and interact with the user. A monitor is an electronic visual display that connects to your computer or laptop. It is used for displaying images, text, videos, games, web pages, and more. Monitors are available in different sizes depending on the needs of the person using them. The most common types of monitors are CRT (cathode ray tube), LCD (liquid crystal display), and LED (light-emitting diode).

4. Motherboard

The motherboard is the backbone of our computer system. It's the central processing unit or CPU. It connects all the other components, like memory and graphics card, to the power supply. The motherboard is where all the wires are plugged in and it's also where you place your RAM, which is your computer's working memory. The motherboard is what makes one machine different from another.

Motherboards are made up of tiny transistors that control the flow of electricity through copper tracks on their surface. These transistors are called Integrated Circuits or ICs for short.

5. CPU (Central Processing Unit)

A CPU, or central processing unit, is the brain of a computer. The CPU processes information and runs programs. It functions as a control unit that executes programs according to instructions in its program memory. The CPU contains elements such as registers, an arithmetic logic unit (ALU), and control logic for sequencing instructions.

6. RAM Memory

A computer's RAM is a type of computer memory that stores information so the CPU can access it directly. Computer systems use main memory to store both data and programs. The more RAM you have, the more data your system can process at one time. This will lead to more efficient operations on your computer, which translates into better performance for the user.

7. ROM Memory

ROM stands for a type of memory chip that can be read from but not written to. In other words, it's a form of data storage that can't be changed after being programmed. It's sometimes called "non-volatile" memory because the stored information will remain even when not powered up or in use. ROM is often used to store a computer's basic start-up instructions and certain types of data, such as your car's on-board computer system and a calculator's data tables.

8. Hard Disk Drive

A hard disk drive is a piece of hardware inside a computer that stores information. It's used to store software and data in a safe place, which can be accessed when needed. With magnetic storage, there are no moving parts - unlike a CD or DVD player in which you need to move a disk in order

to access data. You can think of it as "a closet" where all your stuff is stored safely. As long as you have power, you can get to your things when you need them.

9. Optical Drive

Optical Drives are used in PCs to read and write CDs and DVDs. The optical drive reads the data from the disc, which can then be transformed into a digital file that is readable by the computer. This makes it easy to backup files, play music or movies, or copy data from one disc to another. The term "CD" refers to Compact Discs, which are the most common type of optical drive on modern computers. They are often used for installing software on your computer, moving data between computers, or writing new programs.

10. Power Supply

A power supply is an electrical appliance that provides the necessary power to operate a computer. Computers are powered by electricity, and the power supply converts the alternating current (AC) from the electric outlet into direct current (DC). The power supply in a computer can be an internal or external component.

2. Install latest version of Ubuntu on a virtualbox

Procedure:

- 1. Download and Virtualbox Windows 10 Installation
- 2. Ubuntu ISO download
- 3. Install Virtualbox
- 4. Create an Ubuntu VM
- 5. Install Ubuntu on Virtualbox Windows 10 6. Install Virtualbox Guest Additions

Download and Virtualbox Windows 10 Installation

- 1. Install Ubuntu on VirtualBox
- 2. HowTo Install Ubuntu On VirtualBox?
 - 2.1. Open VirtualBox
 - 2.2. Click on "New" to create a virtual machine
 - 2.3. Enter Name for your Virtual Machine
 - 2.4. Select "Linux" Operating System from "Type"
 - 2.5. Click "Next"
 - 2.6. Enter amount of memory (RAM) =1024 MBand click "Next"
 - 2.7. Click "Create" to create hard drive
 - 2.8. Click "Next"
 - 2.9. Click "Next"
 - 2.10. Enter Size of Virtual Hard Drive= 20 GBand Click "Create"
 - 2.11. Select Virtual Machine
 - 2.12. Click on "Start" to start the virtual machine
 - 2.13. Select disk file source
 - 2.14. Afterselecting the OS file to be installed click "Open"
 - 2.15. Click "Start"
 - 2.16. Click "Ok"
 - 2.17. Click "Install Ubuntu"

- 2.18. Click "Continue"
- 2.19. Click "Install Now"
- 2.20. Click "Continue"
- 2.21. Select location and click "Continue"
- 2.22. Select keyboard layout & click "Continue"
- 2.23. Fill all the details and Click "Continue"
- 2.24. Now the installation process will start and installation window will appear
- 2.25. Click "Restart Now"
- 2.26. When the system will get restarted the following message will appear. Press "Enter"
- 2.27. Close the pop-up messages by clicking on the Close (×) button
- 3. Steps To Maximize The Size Of Ubuntu Desktop
 - 3.1. Go to "Devices"
 - 3.2. Click "Insert Guest Additions CD Image..."
 - 3.3. Click "Run"
 - 3.4. Click "Authenticate"
 - 3.5. Press "Enter"
 - 3.6. Now "Restart" your system for the changes to be applied.
 - 3.7. After the system gets restarted. Go to "View"
 - 3.8. Click "Switch to Full screen"
 - 3.9. Click "Switch"

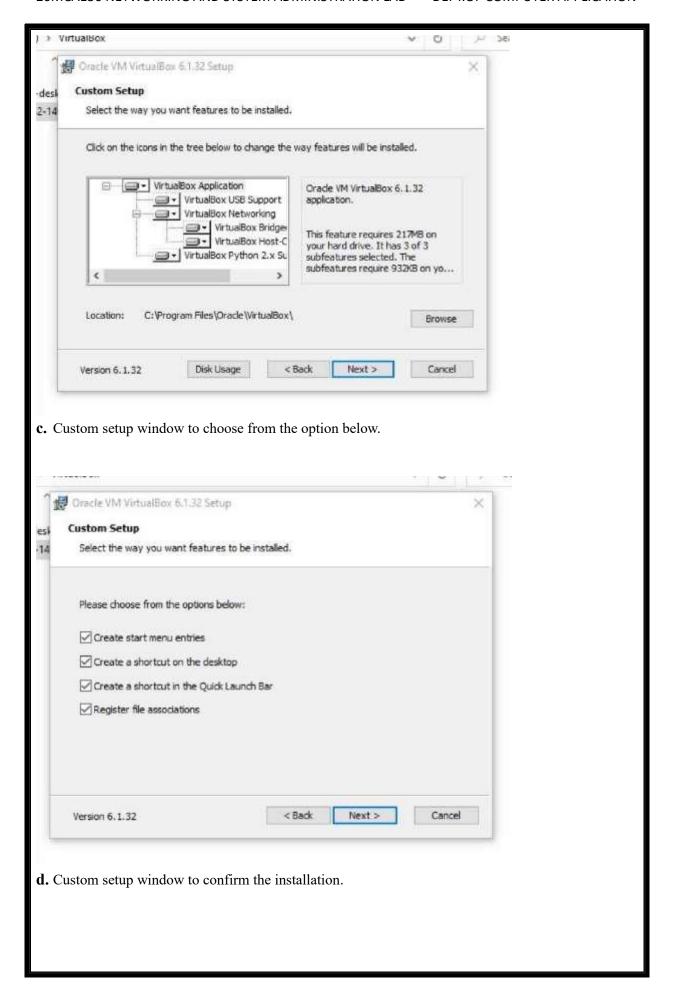

Output Screenshot

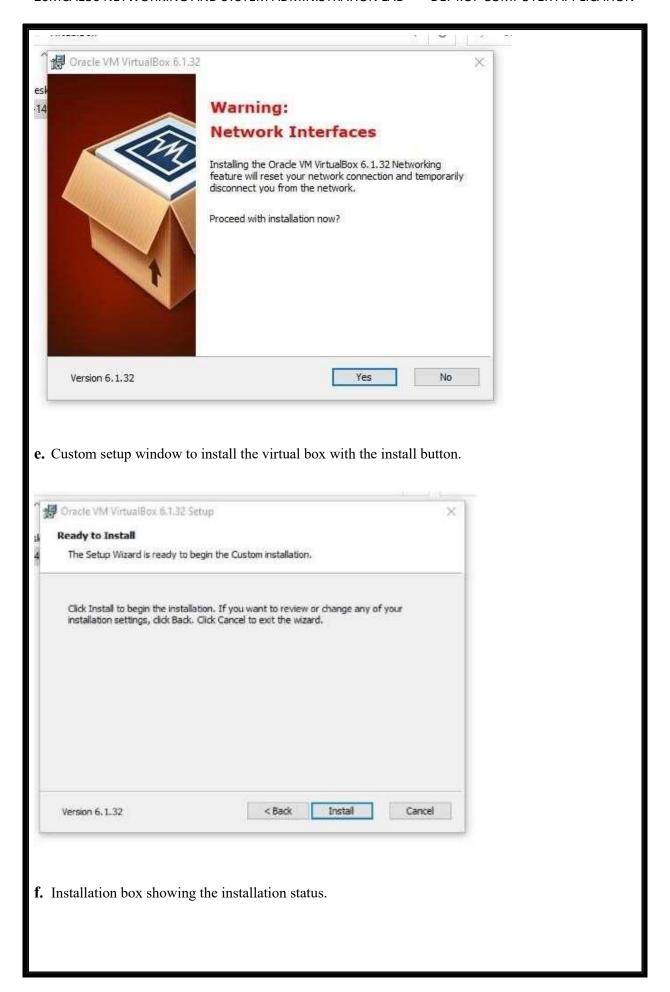

STEP 1: Installing Virtual Box.

a. Starting pop-up window for the installation.

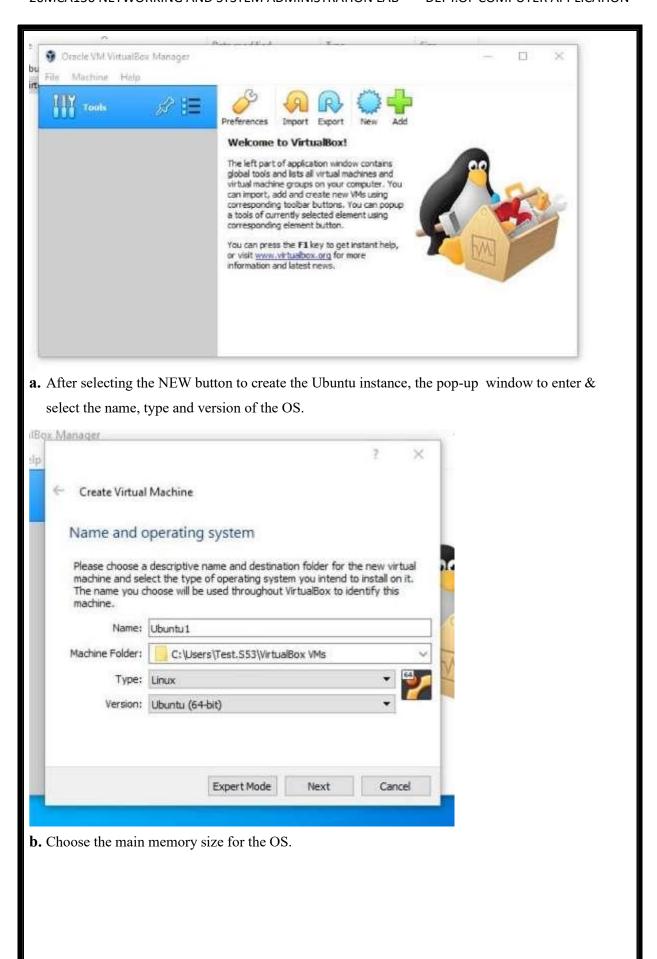

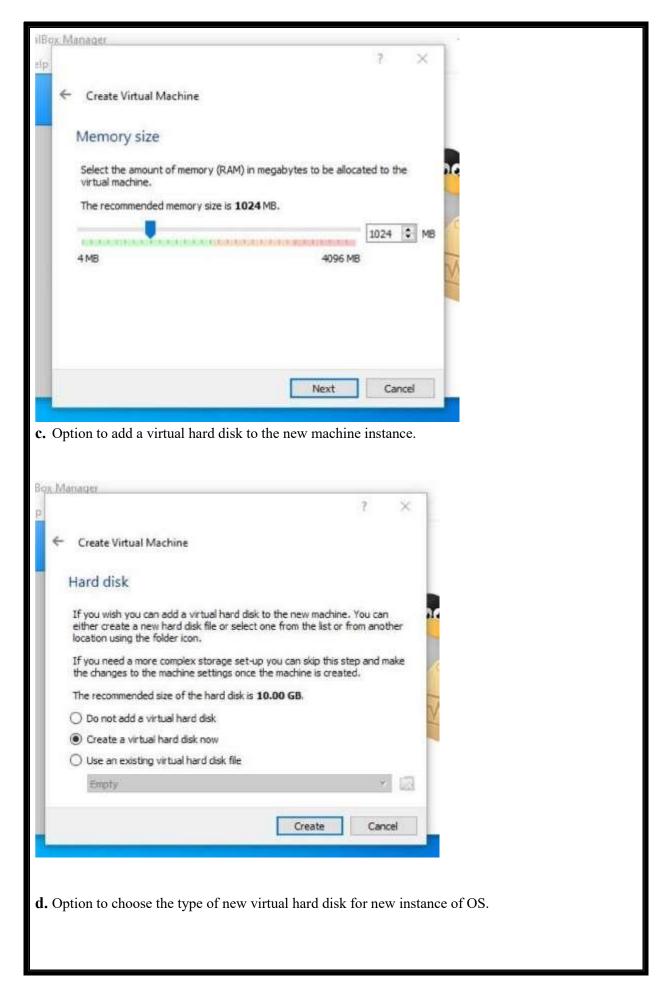

b. Custom setup window to select the features you want and select installation location

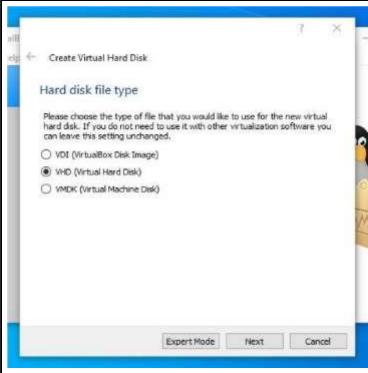

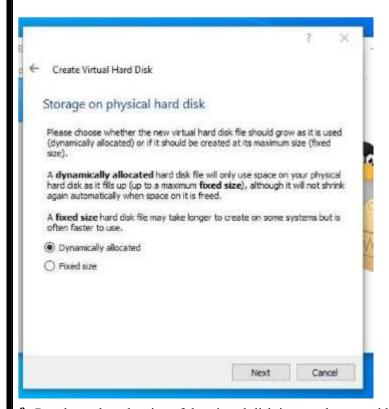

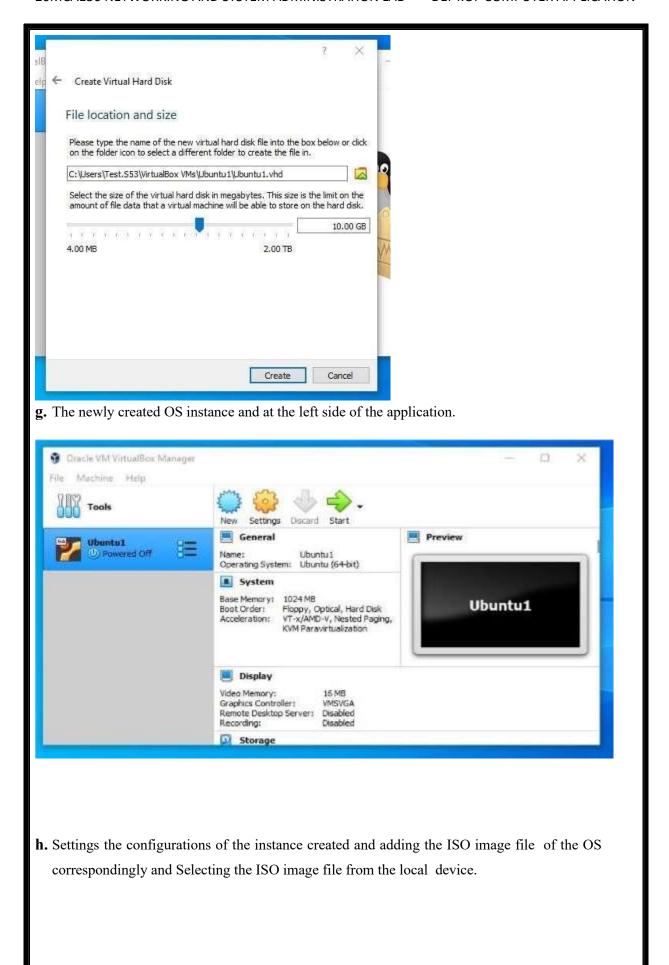

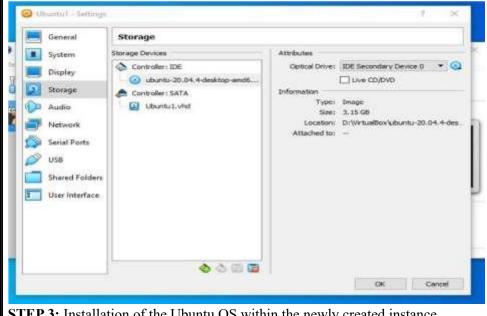

e. Options to choose the methods of accessing the physical hard disk space for the new instance from the existing hard disk

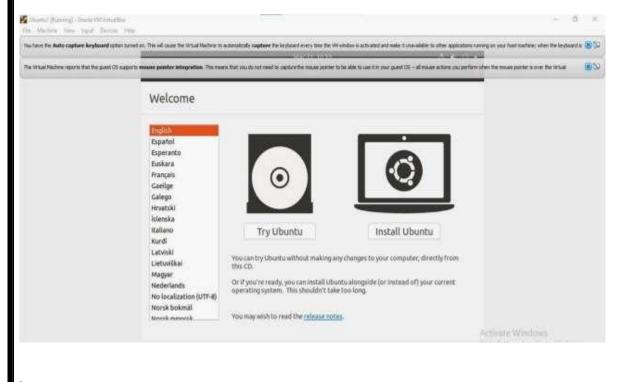

f. Panel to select the size of the virtual disk in megabytes and location and name of the instance and final submit to create the instance of OS.

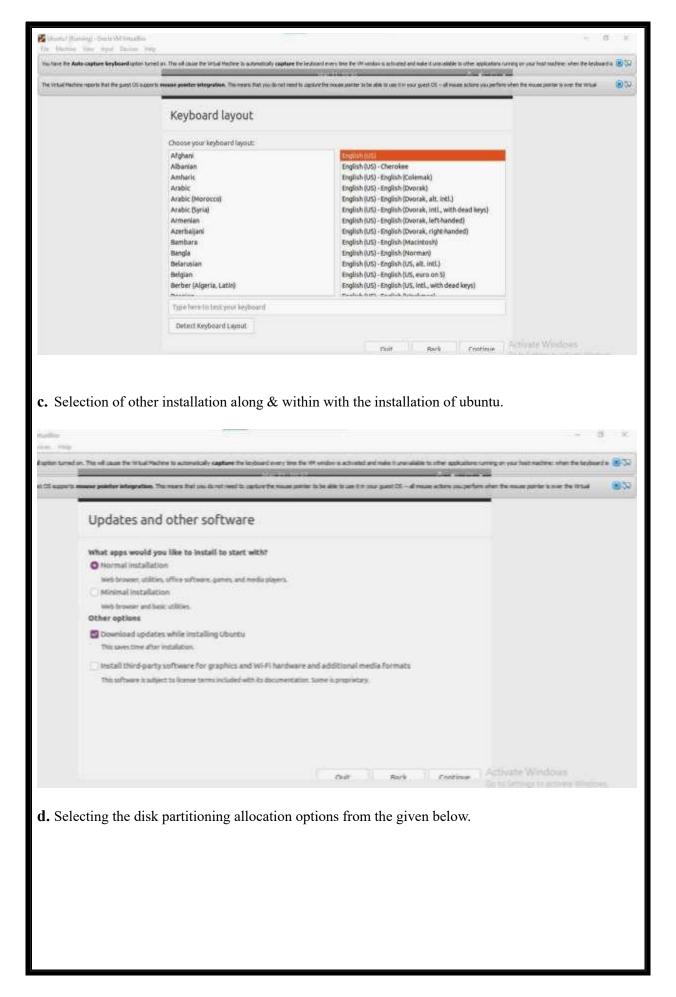

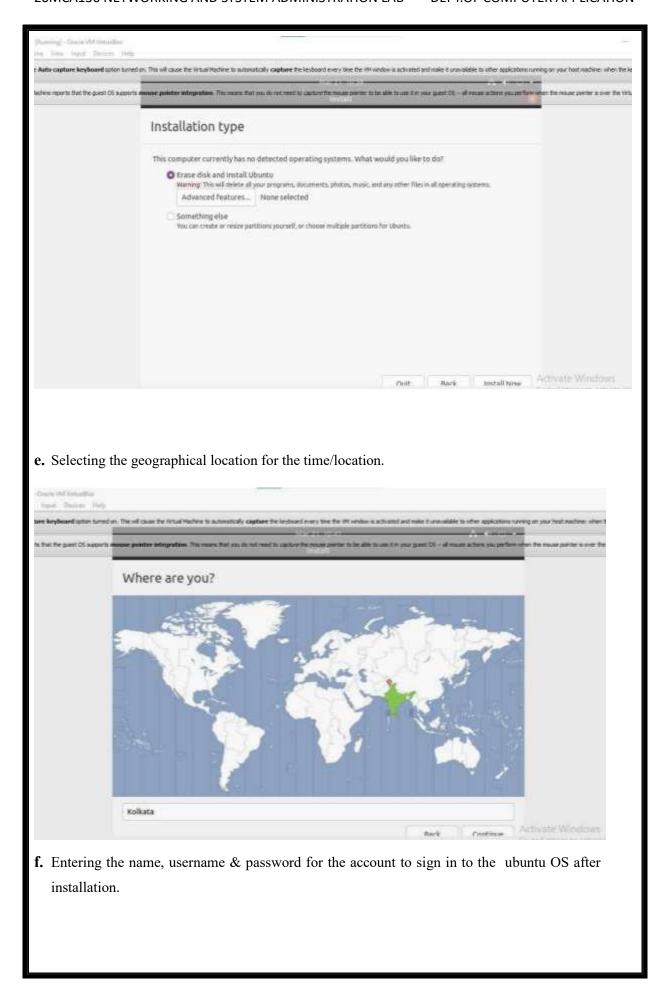

STEP 3: Installation of the Ubuntu OS within the newly created instance.

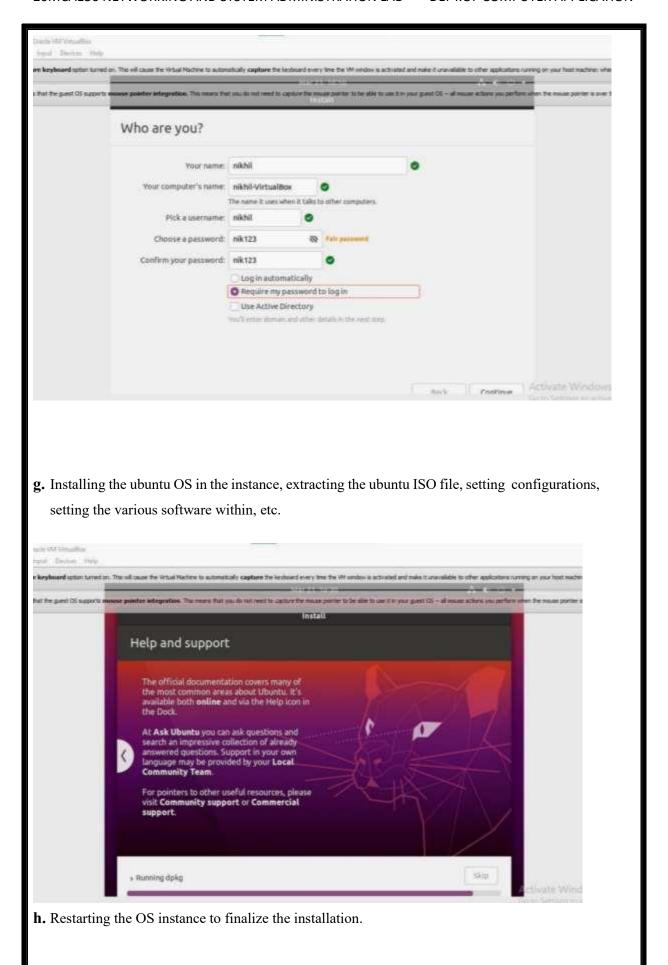

a. Running the new OS instance and selecting the "Install Ubuntu" to install the loaded ISO file.

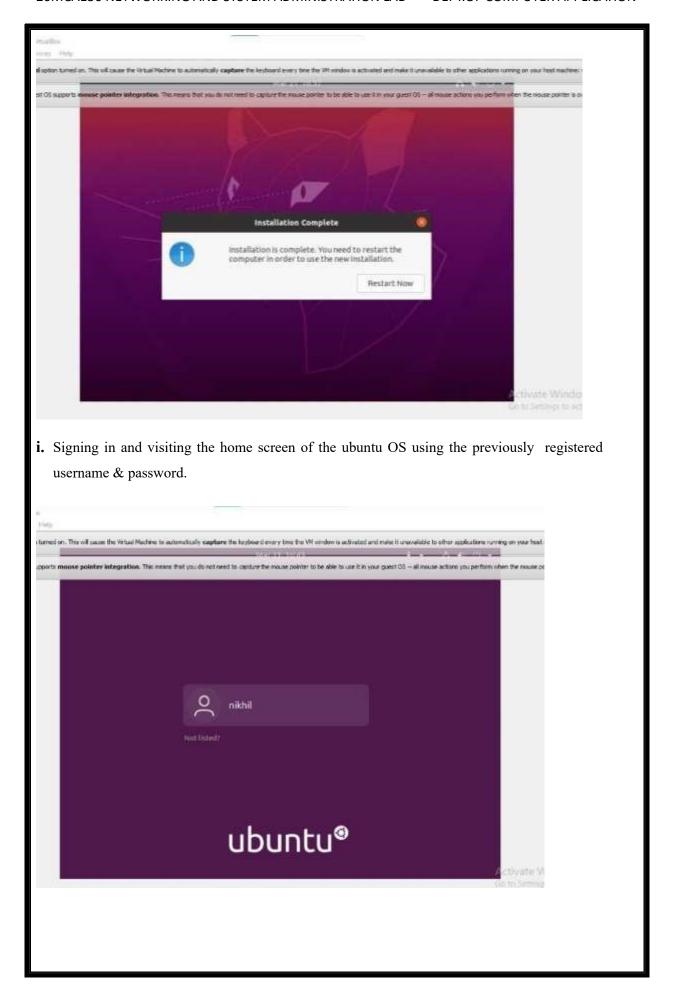

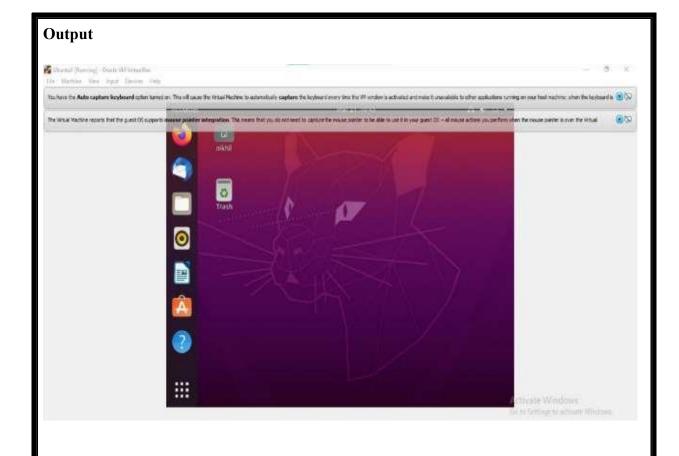

b. Selecting the language for install the ubuntu OS.

3. Study of a terminal based text editor such as Vim or Gedit, Basic Linux commands: - familiarity with following commands/operations expected

Procedure

Pwd: This command is used to display the location of the current working directory.

Syntax :-\$ pwd

Output

student@S25:~\$ pwd /home/student

Mkdir: This command is used to create a new directory under any directory.

Syntax :- \$ mkdir < directory name >

Output

student@S25:~\$ mkdir stud1 student@S25:~\$ pwd /home/student **ls:** This command is used to display a list of content of directory.

Syntax :-\$ ls

Output

```
student@S25:~$ ls

Desktop Downloads Music Public snap Templates

Documents examples.desktop Pictures PycharmProjects studi Videos
```

Man: This command is used to display the user manual of any command that we can run on the terminal.

Syntax :- \$ man < command name >

```
student@S47:~$ man pwd
```

Cd: This command is used to change the current directory.

Syntax :-\$ cd <directory name>

Output

```
student@S46:~$ cd stardust
student@S46:~/stardust$ cd ..
```

- **cd..:** This command is used to move to the parent directory of current directory, or the directory one level up from the current directory.
- > cd -: This command is used to switch back to previous directory we were working earlier.

cat > **filename:** This command is used to create a file and add contents to that file.

Syntax:-\$ cat > filename.txt cat filename: This command is used to

view the contents in the file.

Syntax :-\$ cat filename.txt

```
Output
student@S46:~/stardust$ cat >a.txt
Nertwork is good
^Z
[1]+ Stopped
                                         cat > a.txt
cat>>filename: This command is used to add contents to an existing file. Syntax :-$
cat >> filename.txt
Output
student@S46:~/stardust$ cat>>a.txt
 rlmca136
 ^Z
[2]+ Stopped
                                         cat >> a.txt
cat filename1 > filename2: This command is used to copy the content from one file to
another file.
Syntax :-$ cat filename1 > filename2
Output
student@S46:~/stardust$ cat a.txt > b.txt
student@S46:~/stardust$ cat b.txt
Nertwork is good
 ^Z
rlmca136
read: This command is used to read the content of a line to a variable.
Syntax :- $ read variablename
Find: This command is used to display contents of particular directory.
Syntax :-$ find filename.txt grep :This command will let you search
through all the text in a given file.
Syntax :-$ grep word filename.txt
Output:-
   grep -i: command used for a case insensitive search
       Syntax: $ grep -i filename.txt
    grep -v: command used for inverted search.
```

Syntax: \$ grep -v filename.txt

grep -A1:command used to display line after the result.

Syntax: \$ grep -A1 filename.txt

grep -B1:command used to display line before the result.

Syntax: \$ grep -B1 filename.txt

grep -C1:command used to display line before and after the result.

Syntax: \$ grep -C1 filename.txt **wc-word count:** This command is used for counting purpose which is used to find the number of lines, the number of words, the number of characters and the number of bytes.

- **wc -l** (count number of lines)
- **wc -w** (count number of words)
- **wc -c** (count number of characters)
- **wc-m** (count number of bytes) Syntax :- \$ wc -l filename.txt

\$ wc -w filename.txt

\$ wc -c filename.txt

\$ wc -m filename.txt

Output

```
student@S3:~$ cat marvel1
captian america
ironman
spiderman
hulk
xmen
strange
student@S3:~$ wc marvel1
6 7 53 marvel1
```

```
student@S3:~$ wc -c marvel1

student@S3:~$ wc -w marvel1

7 marvel1

student@S3:~$ wc -l marvel1

6 marvel1

student@S3:~$ wc -m marvel1

student@S3:~$ wc -m marvel1
```

df: This command is used to get a report on system disc space usage.

Syntax :- \$ df filename.txt

Output

```
student@S3:-$ df
           1K-blocks

56
77
student@S3:~$ cut -d- -f1 b3.txt
english
hindi
maths
```

cut -b:This command is used tocut and display the content based on the specified byte number.

Syntax :-\$ cut -b bytenumber filename

Output

```
student@S3:~$ cut -b 2 mark1
n
a
c
```

cut --complement -c: This command is used to erase the specified character and display the remaining content of the file.

Syntax :-\$ cut --complement -c characternumber filename.txt Output

```
student@S3:~$ cut --complement -c 1 mark1
nglish 67
aths 78
cience 90
```

Paste: This command is used to paste the contents from the specified file. Syntax

:-\$ paste filename

```
student@S3:~$ paste marvel1 marvel2
captian america black pink
ironman bts
spiderman batman
hulk cartoon
xmen tom
strange jerry
```

More: This command is used to view the text files in the command prompt, displaying one screen at a time in case the file is large.

Syntax :- \$ more filename

Cp: This command is used to copy the contents from an existing file to a new file.

Syntax:-\$ cpexisting filenamenew filename

Output

Mv: This command is used to move an existing file or directory from one location to another.

Syntax:-\$ mv filename directory name

Output

```
student@S3:~$ mv dq.txt akhila
student@S3:~$ cd akhila
student@S3:~/akhila$ ls
a.txt b.txt dq.txt _
```

Head: This command is used to display the first 10 lines of the file by default. Syntax: \$\\$ head filename

Output

```
student@S3:~$ head b1.txt
Familiarisation of cat command
Cat having different option
new file

adding content
appending
updating
qweerfttf
adfgtttg
weryhbvf
student@S3:~$ head -4 b1.txt
Familiarisation of cat command
Cat having different option
new file
```

➤ head -number: This command is used to display the lines of the file to the specified number from head.

Tail: This command is used to display the last 10 lines of the file by default.

Syntax :-\$ tail filename

Output

```
student@S3:~$ tail b1.txt
new file

adding content
appending
updating
qweerfttf
adfgtttg
weryhbvf
zfsfg
ojkhh
student@S3:~$ tail -3 b1.txt
weryhbvf
zfsfg
oikhh
```

➤ tail -number: This command is used to display the lines of the file to the specified number from tail.

sudo useradd: This command is used to add new user.

Syntax :-\$ sudo useradd username

Output

```
mca@S3:-$ sudo useradd Akhila
[sudo] password for mca:
Sorry, try again.
[sudo] password for mca:
```

> sudo passwd: This command is used to add password to the user.

Syntax :-\$ sudo passwd username

> sudo usermod: This command is used to add members.

Syntax :-\$sudo usermod -G groupname username delete

- > sudo userdel username used to delete user.
- **sudo groupdel groupname -** used to delete group name.

Syntax :-\$ sudo userdel username

sudo groupdel groupname chmod: This command is used change directory permission of files.

```
chmod +rwx
               chmod -wx
    □ chmod -rwx
Syntax :- $ chmod +wx filename
$ chmod -wx filename
$ chmod -rwx filename
Output
mca@S3:~$ ls
a1.txt Desktop Documents Downloads examples.desktop mozilla.pdf Music Pictures Public PycharmProjects
mca@S3:~$ chmod +rwx a1.txt
mca@53:~$ chmod -wx a1.txt
mca@S3:~$ cat >>a1.txt
bash: a1.txt: Permission denied
mca@S3:~$ chmod -rwx a1.txt
mca@S3:~$ cat a1.txt
chown: This command is used to give ownership to user .
Syntax :- $ sudo chown username filename
Output
mca@S3:~$ sudo useradd Anjali
 mca@S3:~$ sudo chown Anjali a1.txt
Ssh: This command is used to provide a secure encrypted connection between two hosts
over an insecure network.
Syntax :- $ ssh mca@ipaddress
```

```
mca@S40:~$ sudo ssh mca@192.168.6.46
The authenticity of host '192.168.6.46 (192.168.6.46)' can't be established.

AIM: shell script to validate password strength. Here are a few assumptions for the password string. (Length – minimum of 8 characters. Contain both alphabet and number. Include both the small and capital case letters.)

```
read -p "Enter your password: " password if [[ \{\#password\} - lt \ 8 \ ]]; then echo "Password length must be at least 8 characters." exit 1 fi if ! [[ "\{password\} = [A-Za-z]+[0-9]+ ]]; then echo "Password must contain both alphabet and number." exit 1 fi if ! [[ "\{password\} = [a-z]+ ]] || ! [[ "\{password\} = [A-Z]+ ]]; then echo "Password must include both small and capital case letters." exit 1 fi echo "Password is valid."
```

OUTPUT

```
abhi@abhi-VirtualBox:~/Desktop/CN$ chmod +x prgm32.sh
abhi@abhi-VirtualBox:~/Desktop/CN$ ./prgm32.sh
Enter your password: Abc1@123
Password is valid.
abhi@abhi-VirtualBox:~/Desktop/CN$
```

PROGRAM 33

AIM: Shell script to print the count of files and subdirectories in the specified directory.

```
#Author: Merin Babu
echo "Enter directory path: "
read directory
num files=$(find $directory -type f | wc -1)
num directories=$(find $directory -type d | wc -l)
echo "Number of files: $num files"
echo "Number of directories: $num directories"
```

OUTPUT

```
abhi@abhi-VirtualBox:~/Desktop/CN$ chmod +x prgm33.sh
abhi@abhi-VirtualBox:~/Desktop/CN$ ./prgm33.sh
Enter directory path:
/home/abhi/Desktop/CN
Number of files: 35
Number of directories: 1
abhi@abhi-VirtualBox:~/Desktop/CN$
```

PROGRAM 34

AIM: Shell script to reverse the list of strings and reverse each string further in the list.

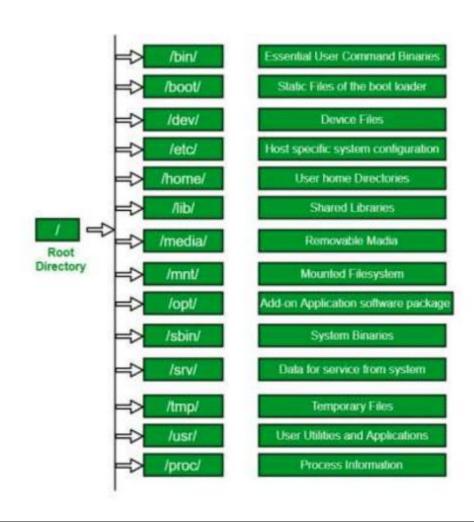

```
#Author: Merin Babu
my list=("string1" "string2" "string3" "string4")
my list=($(echo "${my list[@]}" | tr''\n' | tac | tr'\n''))
for i in "${!my list[@]}"
do
my list[$i]='echo ${my list[$i]} | rev'
done
```

5. File system hierarchy in a common Linux distribution, file and device permissions, study of system configuration files in /etc, familiarizing log files for system events, user activity, network events.

The Linux File Hierarchy Structure or the Filesystem Hierarchy Standard (FHS) defines the directory structure and directory contents in Unix-like operating systems. It is maintained by the Linux Foundation.

- ☐ In the FHS, all files and directories appear under the root directory /, even if they are stored on different physical or virtual devices.
- \Box Some of these directories only exist on a particular system if certain subsystems, such as the X Window System, are installed.
- ☐ Most of these directories exist in all UNIX operating systems and are generally used in much the same way; however, the descriptions here are those used specifically for the FHS, and are not considered authoritative for platforms other than Linux.

The Root Directory

Everything on your Linux system is located under the / directory, known as the root directory. You can think of the / directory as being similar to the C:\ directory on Windows – but this isn't strictly true, as Linux doesn't have drive letters. While another partition would be located at D:\ on Windows, this other partition would appear in another folder under / on Linux.

/bin : Essential command binaries that need to be available in single user mode; for all users, e.g., cat, ls, cp.

☐ Contains binary executables	
☐ Common linux commands you need to use in single-user modes are local	ted under

☐ Commands used by all the users of the system are located here e.g. ps, ls, ping, grep,

ср

this directory.

The /bin directory contains the essential user binaries (programs) that must be present when

the system is mounted in single-user mode. Applications such as Firefox are stored in /usr/bin,while important system programs and utilities such as the bash shell are located in /bin. The /usr directory may be stored on another partition – placing these files in the /bin directory ensures the system will have these important utilities even if no other file systems are mounted. The /sbin directory is similar – it contains essential system administration binaries.

/boot – Static Boot File: The /boot directory contains the files needed to boot the system – for example, the GRUB boot loader's files and your Linux kernels are stored here. The boot loader's configuration files aren't located here, though – they're in /etc with the other configuration files.

/cdrom – Historical Mount Point for CD-ROMs

The /cdrom directory isn't part of the FHS standard, but you'll still find it on Ubuntu and other operating systems. It's a temporary location for CD-ROMs inserted in the system. However,the standard location for temporary media is inside the /media directory.

/dev – Device Files

Linux exposes devices as files, and the /dev directory contains a number of special files that represent devices. These are not actual files as we know them, but they appear as files – for example, /dev/sda represents the first SATA drive in the system. If you wanted to partition it, you could start a partition editor and tell it to edit /dev/sda.

This directory also contains pseudo-devices, which are virtual devices that don't actually

correspond to hardware. For example, /dev/random produces random numbers. /dev/null is a special device that produces no output and automatically discards all input – when you pipe the output of a command to /dev/null, you discard it.

/etc – Configuration Files

The /etc directory contains configuration files, which can generally be edited by hand in a text editor. Note that the /etc/ directory contains system-wide configuration files – user-specific configuration files are located in each user's home directory.

/home - Home Folders

The /home directory contains a home folder for each user. For example, if your user name is bob, you have a home folder located at /home/bob. This home folder contains the user's data files and user-specific configuration files. Each user only has write access to their own home folder and must obtain elevated permissions (become the root user) to modify other files on the system.

/lib – Essential Shared Libraries

The /lib directory contains libraries needed by the essential binaries in the /bin and /sbin folder.Libraries needed by the binaries in the /usr/bin folder are located in /usr/lib.

/lost+found – Recovered Files

Each Linux file system has a lost+found directory. If the file system crashes, a file system check will be performed at next boot. Any corrupted files found will be placed in the lost+found directory, so you can attempt to recover as much data as possible.

/media – Removable Media

The /media directory contains subdirectories where removable media devices inserted into the computer are mounted. For example, when you insert a CD into your Linux system, a directory will automatically be created inside the /media directory. You can access the contents of the CD inside this directory.

/mnt – Temporary Mount Points

Historically speaking, the /mnt directory is where system administrators mounted temporary file systems while using them. For example, if you're mounting a Windows partition to perform some file recovery operations, you might mount it at /mnt/windows. However, you can mount other file systems anywhere on the system.

/opt - Optional Packages

The /opt directory contains subdirectories for optional software packages. It's commonly used by proprietary software that doesn't obey the standard file system hierarchy – for example, a proprietary program might dump its files in /opt/application when you install it.

/proc – Kernel & Process Files

The /proc directory similar to the /dev directory because it doesn't contain standard files. It contains special files that represent system and process information.

/root – Root Home Directory

The /root directory is the home directory of the root user. Instead of being located at /home/root, it's located at /root. This is distinct from /, which is the system root directory.

/run – Application State Files

The /run directory is fairly new, and gives applications a standard place to store transient files they require like sockets and process IDs. These files can't be stored in /tmp because files in /tmp may be deleted.

/sbin - System Administration Binaries

The /sbin directory is similar to the /bin directory. It contains essential binaries that are generally intended to be run by the root user for system administration

/selinux – SELinux Virtual File System

If your Linux distribution uses SELinux for security (Fedora and Red Hat, for example), the /selinux directory contains special files used by SELinux. It's similar to /proc. Ubuntu doesn't use SELinux, so the presence of this folder on Ubuntu appears to be a bug.

/srv - Service Data

The /srv directory contains "data for services provided by the system." If you were using the Apache HTTP server to serve a website, you'd likely store your website's files in a directory inside the /srv directory.

/tmp – Temporary Files

Applications store temporary files in the /tmp directory. These files are generally deleted whenever your system is restarted and may be deleted at any time by utilities such as tmpwatch.

/usr – User Binaries & Read-Only Data

The /usr directory contains applications and files used by users, as opposed to applications and files used by the system. For example, non-essential applications are located inside the /usr/bin directory instead of the /bin directory and non-essential system administration binaries are located in the /usr/sbin directory instead of the /sbin directory. Libraries for each are located inside the /usr/lib directory. The /usr directory also contains other directories — for example,architecture-independent files like graphics are located in /usr/share.The /usr/local directory is where locally compiled applications install to by default — this prevents them from mucking up the rest of the system.

/var – Variable Data Files

The /var directory is the writable counterpart to the /usr directory, which must be read-only in normal operation. Log files and everything else that would normally be written to /usr during normal operation are written to the /var directory. For example, you'll find log files in /var/log.

6. Installation and configuration of LAMP stack. Deploy an open source
application such as phpmyadmin and Wordpress.
Procedure
Install Apache2
□ Update your system:
sudo apt update
<pre>mca@53:~\$ sudo apt update Hit:1 http://packages.microsoft.com/repos/vscode stable InRelease Hit:2 http://in.archive.ubuntu.com/ubuntu bionic InRelease Err:3 http://ppa.launchpad.net/jonathonf/python-3.6/ubuntu bionic InRelease 403 Forbidden [IP: 185.125.190.52 80] Ign:4 https://repo.mongodb.org/apt/ubuntu trusty/mongodb-org/3.6 InRelease Hit:5 http://ppa.launchpad.net/webupd8team/java/ubuntu bionic InRelease Get:6 https://repo.mongodb.org/apt/ubuntu trusty/mongodb-org/3.6 Release [2,495 8] Get:7 https://repo.mongodb.org/apt/ubuntu trusty/mongodb-org/3.6 Release.gpg [801 8] Err:7 https://repo.mongodb.org/apt/ubuntu trusty/mongodb-org/3.6 Release.gpg</pre>
☐ Install Apache using apt:
sudo apt install apache2
Reading package lists Done Building dependency tree Reading state information Done Building state information Done apache2 is already the newest version (2.4.29-lubuntu4). The following packages were automatically installed and are no longer required: debhelper dh-autoreconf dh-strip-nondeterminism libarchive-cpio-perl libfile-stripnondeterminism-perl libmail-sendmail-perl libpcre16-3 libpcre3-dev libpcre32-3 libpcrecppdv5 libssl-dev libssl-doc libsys-hostmame-long-perl php-common php-pear php-xml php7.2-cli php7.2-common php7.2-json php7.2-opcache php7.2-readline php7.2-xml pkg-php-tools po-debconf shtool Use 'sudo apt autoremove' to remove them. 6 upgraded, 8 newly installed, 8 to remove and 8 not upgraded.
☐ Confirm that Apache is now running with the following command:
sudo systemetl status apache2
☐ If it is not working!
sudo systemetl stop apache2 # to stop if running
sudo systemetl start apache2 # to start if not running
\Box Once installed, test by accessing your server's IP in your browser:
http://127.0.0.1/
http://localhost/

Apache2 Ubuntu Default Page This is the default welcome page used to test the correct operation of the Apache2 server after installation on Ubuntu systems. It is based on the equivalent page on Debian, from which the Ubuntu Apache packaging is derived. If you can read this page, it means that the Apache HTTP server installed at this site is working properly. You should replace this file (located at /var/van/html/index.html) before continuing to operate your HTTP server If you are a normal user of this web site and don't know what this page is about, this probably means that the site is currently unavailable due to maintenance. If the problem persists, please contact the site's administrator Ubuntu's Apache2 default configuration is different from the upstream default configuration, and split into several files optimized for interaction with Ubuntu tools. The configuration system is fully documented in Ausr'share(doc/apache2/README.Debian.gz. Refer to this for the full documentation. Documentation for the web server itself can be found by accessing the manual if the apache2-doc package was installed on this server, The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows: |-- apache2.conf |-- mods-enabled !-- *.load -- *.conf -- conf-enabled -- sites-enabled **Install mariadb** sudo apt install mariadb-server mariadb-client sudo systemctl status mysql # to check status sudo systemetl start mysq # if not running sudo mysql secure installation # Secure your newly installed MariaDB **Install PHP and commonly used modules** □ sudo apt install php libapache2-mod-php php-opcache php-cli php-gd php- curl php-mysql □ sudo systemctl restart apache2 ☐ Test PHP Processing on Web Server sudo nano /var/www/html/phpinfo.php ☐ Inside the file, type in the valid PHP code: <?php phpinfo(); ☐ Press CTRL + X to save and close the file. Press y and ENTER to confirm Open a browser and type in your IP address/phpinfo.php

http://127.0.0.1/phpinfo.php
Install phpmyadmin
sudo apt install phpmyadmin php-mbstring php-zip php-gd php-json php-
curl
sudo systemetl restart apache2
☐ Open a browser : http://localhost/phpmyadmin
username:root
password : yourpassword If php my admin page not found :
nano /etc/apache2/apache2.conf
☐ Add this line to last of the file.
Press CTRL + X to save and close the file. Press y and ENTER to
confirm
Include /etc/phpmyadmin/apache.conf
☐ restart apache2 - now try : http://localhost/phpmyadmin
sudo systemetl restart apache2
$\ \square$ If any problem for login run the following command
sudo mysql
ALTER USER root@localhost IDENTIFIED BY "yourpassword";
Install WordPress with LAMP on Ubuntu 18.04
Step 1 – Download WordPress
Download the latest version of the WordPress package and extract it by
issuing the commands below on the terminal:
□ wget -c <u>http://wordpress.org/latest.tar.gz</u>

```
ica@53:~$ wget -c http://wordpress.org/latest.tar.gz
--2022-06-13 15:24:19-- http://wordpress.org/latest.tar.gz
Resolving wordpress.org (wordpress.org)... 198.143.164.252
Connecting to wordpress.org (wordpress.org)|198.143.164.252|:80... connected.
HTTP request sent, awaiting response... 301 Moved Permanently
ocation: https://wordpress.org/latest.tar.gz [following]
-2022-86-13 15:24:20-- https://wordpress.org/latest.tar.gz
Connecting to wordpress.org (wordpress.org) 198.143.164.252 : 443... connected.
HTTP request sent, awaiting response... 200 OK
Length: 21166276 (20M) [application/octet-stream]
Saving to: 'latest.tar.gz'
latest.tar.gz
                                 2022-06-13 15:24:24 (5.98 MB/s) - 'latest.tar.gz' saved [21166276/21166276]
☐ tar -xzvf latest.tar.gz
mca@53:-$ tar -xzvf latest.tar.gz
wordpress/
wordpress/xmlrpc.php
 wordpress/wp-blog-header.php
wordpress/readme.html
wordpress/wp-signup.php
wordpress/index.php
wordpress/wp-cron.php
wordpress/wp-config-sample.php
wordpress/wp-login.php
wordpress/wp-settings.php
wordpress/license.txt
wordpress/wp-content/
wordpress/wp-content/themes/
wordpress/wp-content/themes/twentytwentyone/
wordpress/wp-content/themes/twentytwentyone/footer.php
wordpress/wp-content/themes/twentytwentyone/template-parts/
Then move the WordPress files from the extracted folder to the Apache
default root directory, /var/www/html/:
□ sudo mv wordpress/* /var/www/html/
Next, set the correct permissions on the website directory, that is give
ownership of the WordPress files to the webserver as follows:
□ sudo chown -R www-data:www-data/var/www/html/
□ sudo chmod -R 755 /var/www/html/
Step 2 – Creating a MySQL Database and User for WordPress
The first step you'll take is a preparatory one. Even though MySQL is
already installed, you still need to create a database to manage and store
```

the user information for WordPress to use. To get started, log into the

MySQL root(administrative) account by issuing the following command:

sudo mysql

You will be prompted for the password you set for the MySQL root
accountwhen you installed the software. However, if you have password
authenticationenabled for your root user, you can run the following
command and enter your password information when prompted:

mysql -u root -p

From there, you'll create a new database that WordPress will control. You
can call this whatever you would like, but we will be using wordpress in
this guideas an example. Create the database for WordPress by writing the
following:

CREATE DATABASE wordpress DEFAULT CHARACTER
SET utf8 COLLATE utf8_unicode_ci;

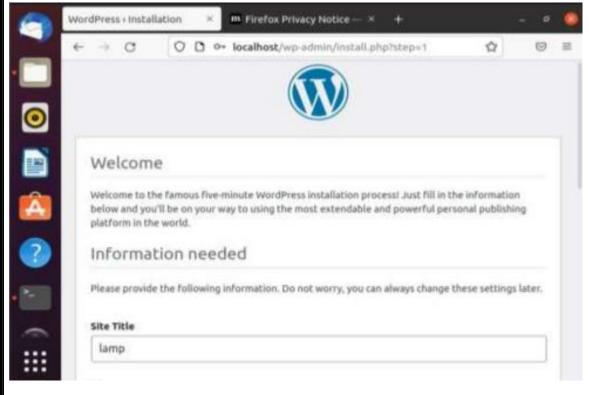

Next, you're going to create a separate MySQL user account that you'll useexclusively to operate on the new database. Creating one-function databases and accounts is a good idea from a management and security standpoint. We willuse the name wordpressuser as an example in this guide. Feel free to change thisif you'd like. You can create this account,

set a password for it, and then grant it access to thedatabase you created
all by running the following command. Remember tochoose a strong
password here for your database user:
☐ GRANT ALL ON wordpress.* TO
'wordpressuser'@'localhost'IDENTIFIED BY 'password';
After creating this user, flush the privileges to ensure that the current
instance of MySQL knows about the recent changes you've made:
☐ FLUSH PRIVILEGES;
Exit out of MySQL:
You now have a database and user account in MySQL, each made
specifically for WordPress. Go the /var/www/html/ directory and rename
existing wp-config-sample.php to wpconfig.php. Also, make sure to
remove the default Apache index page.
□ cd /var/www/html/
□ sudo mv wp-config-sample.php wp-config.php
□ sudo rm -rf index.html
mca@S3:~\$ cd /var/www/html/
mca@S3:/var/www/html\$ sudo mv wp-config-sample.php wp-config.php
mca@S3:/var/www/html\$ sudo rm -rf index.html
Then update it with your database information under the MySQL settings
section (refer to the highlighted boxes in the image below):This setting
can be added after the database connection settings, or anywhere
else in the file: Save and close the file when you are finished.Restart the
web server and mysql service using the commands below:
□ sudo systemctl restart apache2.service
☐ sudo systemctl restart mysql.service
mca@S46:/var/www/html\$ sudo systemctl restart apache2.service mca@S46:/var/www/html\$ sudo systemctl restart mysql.service Sten 3 - Completing the Installation Through the Web Interface

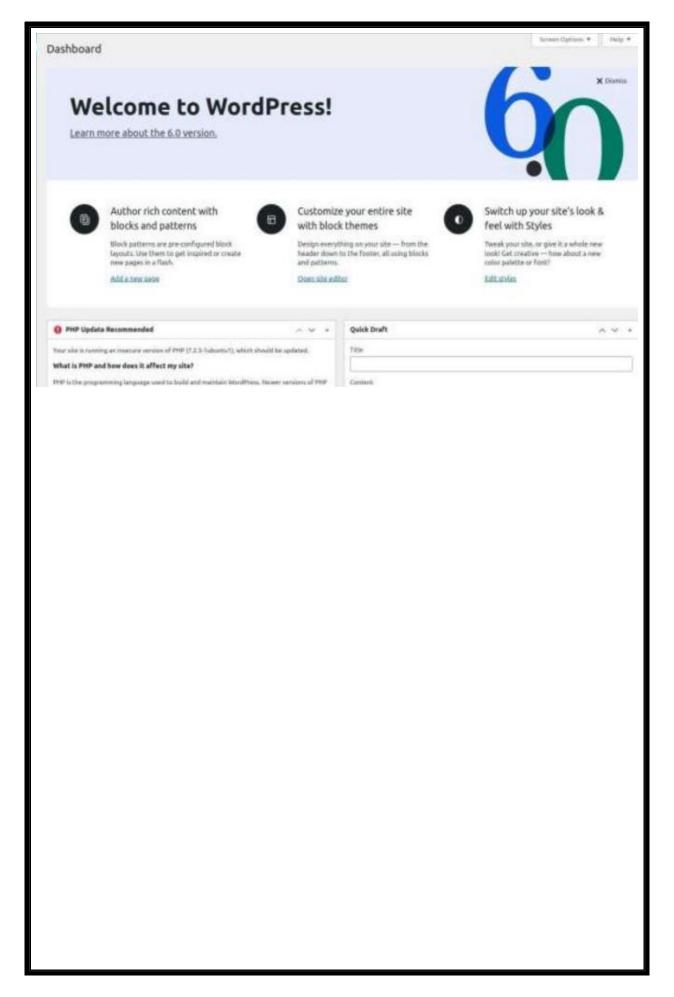

Now that the server configuration is complete, you can complete the installation through the web interface. In your web browser, navigate to your server's domain name or public IP address:

☐ https://server domain or IP

Select the language you would like to use: Next you will be directed to the main setup page. Select a name for your WordPress site and choose a username (it is recommended not to choose something like "admin" for security purposes). A strong password is generated automatically. Save this password or select an alternative strong password. Enter your email address and select whether you want to discourage search engines from indexing your site: Once you log in, you will be taken to the WordPress administration dashboard: From there, you can begin using and customizing your WordPress site

Once you log in, you will be taken to the WordPress administration dashboard: From there, you can begin using and customizing your WordPress site.

7. Build and install software from source code, familiarity with make and cmake utilities expected.

Procedure & Output Screenshot

Install the cmake

Apt show cmake

```
ca@S3:~/Documents/CHake$ apt show cmake
ackage: cnake
Version: 3.10.2-1ubuntu2
riority: optional
Section: devel
Origin: Ubuntu
laintainer: Ubuntu Developers <ubuntu-devel-discuss@lists.ubuntu.com>
Original-Maintainer: Debian CMake Team <pkg-cmake-team@lists.alioth.debian.org>
ugs: https://bugs.launchpad.net/ubuntu/+filebug
Installed-Size: 17.3 MB
epends: cmake-data (= 3.10.2-1ubuntu2), procps, libarchive13 (>= 3.0.4), libc6 (>= 2.15), libcurl4 (>= 7.16.2), libexpat1 (>= 2.0.1), libgcc1
(>= 1:3.0), libjsoncpp1 (>= 1.7.4), librhash0 (>= 1.2.6), libstdc++6 (>= 5.2), libuv1 (>= 1.4.2), zlib1g (>= 1:1.2.3.3)
Recommends: gcc, make
Suggests: cmake-doc, ninja-build
omepage: https://cmake.org/
upported: 5y
```

□ \$sudo apt install cmake g++ make: To install cmake, g++ and make using the apt command.

```
mca@S3:~/Documents/CMake$ sudo apt install cmake g++ make
[sudo] password for mca:
Reading package lists... Done
Building dependency tree
Reading state information... Done
g++ is already the newest version (4:7.3.0-3ubuntu2).
make is already the newest version (4.1-9.1ubuntu1).
make set to manually installed.
The following packages were automatically installed and are no longer required:
 debhelper dh-autoreconf dh-strip-nondeterminism libarchive-cpio-perl
  libfile-stripnondeterminism-perl libmail-sendmail-perl libpcre16-3
 libpcre3-dev libpcre32-3 libpcrecpp0v5 libssl-dev libssl-doc
 libsys-hostname-long-perl php-common php-pear php-xml php7.2-cli
 php7.2-common php7.2-json php7.2-opcache php7.2-readline php7.2-xml
 pkg-php-tools po-debconf shtool
Use 'sudo apt autoremove' to remove them.
The following additional packages will be installed:
 cmake-data libcurl4 libjsoncpp1 librhash0 libuv1
Suggested packages:
```

Create directory

☐ Mkdir cmake: creating a different directory for our project using

the mkdir and cd commands.

mca@S3:~/Documents/CMake\$ mkdir myproject

☐ Cd cmake mca@S3:~/Documents/CMake\$ cd myproject ☐ gedit Helloworld.cpp Now create a C++ source file named Hello world.cpp and add the following: gedit CmakeLists.txt Create a CMakeLists.txt file(with this exact capitalization) which is required by CMake: Create directory called Mkdir build: To run cmake we need to change into the build directory: Cmake... mca@S3:~/Documents/CMake/myproject/build\$ cmake ... - The C compiler identification is GNU 7.3.0 - The CXX compiler identification is GNU 7.3.0 Check for working C compiler: /usr/bin/cc -- Check for working C compiler: /usr/bin/cc -- works Detecting C compiler ABI info - Detecting C compiler ABI info - done - Detecting C compile features Detecting C compile features - done -- Check for working CXX compiler: /usr/bin/c++ Check for working CXX compiler: /usr/bin/c++ -- works - Detecting CXX compiler ABI info - Detecting CXX compiler ABI info - done Detecting CXX compile features Detecting CXX compile features - done Configuring done Generating done ☐ Cmake –build : To generate the executable simply by typing:run hello mca@S3:~/Documents/CMake/myproject/build\$ cmake --build . Scanning dependencies of target hello 50%] Building CXX object CMakeFiles/hello.dir/Hello world.cpp.d [100%] Linking CXX executable hello [100%] Built target hello ☐ ./hello: Run the executable by typing: mca@S3:~/Documents/CMake/myproject/build\$./hello Hello World!

8. Introduction to command line tools for networking IPv4 networking, network commands: ping route traceroute, nslookup, ip. Setting up static and dynamic IP addresses. Concept of Subnets, CIDR address schemes, Subnet masks, iptables, setting up a firewall for LAN, Application layer (L7) proxies.

Procedure

1. **ifconfig**: This commands in windows allows you to see a summarized information of your network such as ip address, subnet mask, server address etc.

Output

```
sjcet@Z238-UL:~/kishor/sem2/CN$ ifconfig
eno1: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500
       inet 172.16.54.197 netmask 255.255.240.0 broadcast 172.16.63.255
       inet6 fe80::a4fb:b17f:9247:b333 prefixlen 64 scopeid 0x20<link>
       ether 3c:52:82:6e:b2:a7 txqueuelen 1000 (Ethernet)

       TX packets 5842 bytes 546463 (546.4 KB)
       TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0
```

2. nslookup: To show the server to which the system is connected by default. If we want to find the ip address of a particular domain name, we can also use nslookup

```
sjcet@Z238-UL:~/kishor/sem2/CN$ nslookup google.com
Server: 127.0.0.53
Address: 127.0.0.53#53

Non-authoritative answer:
Name: google.com
Address: 142.250.193.142
Name: google.com
Address: 2404:6800:4007:81f::200e
```

3. ping : The command used to check the availability of a host. The response shows the URL you are pinging, the ip address associated with the URL and the size of packets being sent on

the first line. The next four lines shows the replies from each individual packets including the time(in milliseconds) for the response and the time to live(TLL) of the packet, that is the

amount of time that must pass before the packet discarded.

```
sjcet@Z238-UL:~/kishor/sem2/CN$ ping -c 4 google.com
PING google.com (142.250.196.46) 56(84) bytes of data.

6. hostname : The hostname command is a command-line utility in Linux and other Unix-like operating systems that allows you to view or set the hostname of the system. The hostname is the unique name assigned to a computer within a network.

```
sjcet@Z238-UL:~/kishor/sem2/CN$ hostname
Z238-UL
```

7. arp : The arp command is a command-line utility in Linux and other Unix-like operating systems that allows you to view and manipulate the Address Resolution Protocol (ARP) cache, which is used to map IP addresses to MAC addresses on a local network. ARP is essential for communication between devices within the same subnet.

```
sjcet@Z238-UL:~/kishor/sem2/CN$ arp -a
_gateway (172.16.48.2) at 7c:5a:1c:cf:50:b9 [ether] on eno1
```

8. uname : The uname command is a command-line utility in Linux and other Unix-like operating systems that provides information about the system's kernel and operating system. It's used to retrieve information about the system's architecture, release version, and other details.

sjcet@ZZ38-UL:~/kishor/sem2/CN\$ uname -a Linux ZZ38-UL 5.4.0-147-generic #164-Ubuntu SMP Tue Mar 21 14:23:17 UTC 2023 x86 64 x86 64 x86 64 GNU/Linux

9. Analyzing network packet stream using tcpdump and wireshark. Perform basic network service tests using nc.

Procedure

1. How to Install tendump in Linux

Many Linux distributions already shipped with the tcpdump tool, if in case you don't have it on a system, you can install it using the command.

□ \$ sudo apt-get install tcpdump [On Debian, Ubuntu and Mint]

2. Display Available Interfaces

To list the number of available interfaces on the system, run the following command with -D option.

3. Capture Packets from Specific Interface

The command screen will scroll up until you interrupt and when we execute the tcpdump command it will captures from all the interfaces, however with -i switch only capture from the desired interface.

4. Capture Only N Number of Packets

When you run the topdump command it will capture all the packets for the specified interface, until you hit the cancel button. But using -c option, you can capture a specified number of packets.

tcpdump -c 5 -i enp3s0

5. Display Captured Packets in HEX and ASCII

The following command with option -XX capture the data of each packet, including its link level header in HEX and ASCII format

6. Capture and Save Packets in a File

As we said, that tcpdump has a feature to capture and save the file in a .pcap format, to do this just execute the command with -w option.

7. Capture Packet from Specific Port

Let's say you want to capture packets for specific port 80, execute the below command by specifying port number 80

8. Read Captured Packets File

To read and analyze captured packet 0001.pcap file use the command with -r option

wire shark

Installing Wireshark on Ubuntu 20.04

The Wireshark utility is available on all major desktop platforms, i.e., Linux, Microsoft Windows, FreeBSD, MacOS, Solaris, and many more. Follow the steps below to install Wireshark on Ubuntu 20.04.

Step 1: Update APT

First, as always, update and upgrade your APT through the following command.

Syntax:

\$ sudo apt update

Step 2: Download and Install Wireshark

Now that Wireshark's latest version has been added to the APT, you can download and install it with the following command.

syntax

\$ sudo apt install wireshark

Step 3: Enable Root Privileges

When Wireshark installs on your system, you will be prompted by the following window. As Wireshark requires superuser/root privileges to operate, this option asks to enable or disable permissions for all every user on the system. Press the "Yes" button to allow other users, or press the "No" button to restrict other users

Step 4:

You must add a username to the Wireshark group so that this user can use Wireshark. To do this, execute the following command, adding your required username after "wireshark" in the command.

Syntax:

\$ sudo adduser \$user wireshark

Step 5: Launch Wireshark

In the terminal window, type the following command to start the

Wireshark application. Syntax:

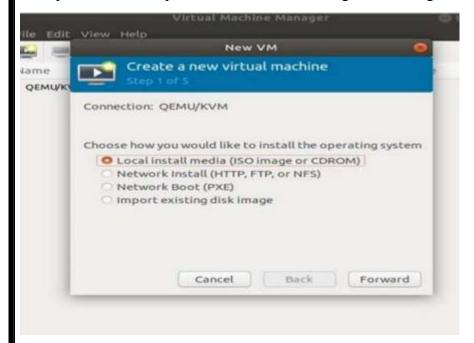

\$ wireshark

You can also open Wireshark through the Graphical User Interface (GUI) by opening the activities on the Ubuntu desktop, and in the search bar, type "Wireshark," and click on the application result.

```
mca@U40:-$ sudo apt install gemu-kvm libvirt-daemon-system libvirt-clients bridge-utils virt-manager
Reading package lists... Done

libvirt-daemon-driver-storage-sheepdog libvirt-daemon-driver-storage-gluster
```

Step 3: Start virt-manager with

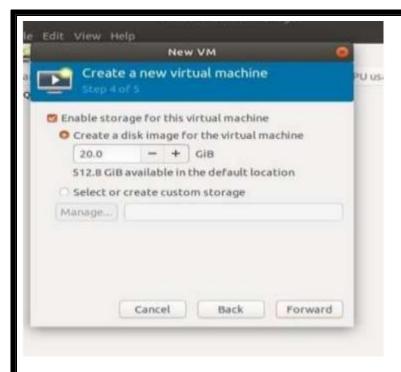

Step 4:In the first window, click the computer icon in the upper-left corner,In the dialogue box that opens, select the option to install the VM using an ISO image. Then click Forward.

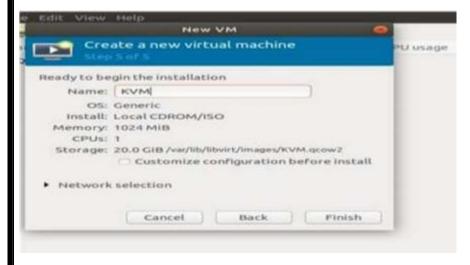

Step 5: Choose ISO, click Forward

Step 6: Enter the amount of RAM and the number of CPUs you wish to allocate to the VM and proceed to the next step.

Step 7: Allocate hard disk space to the VM. Click Forward to go to the last step.

Step 8: Specify the name for your VM and click Finish to complete the setup.

Step 9: Select language

Step 10: The VM starts automatically, prompting you to start installing the OS that's on the ISO file.

Step 11: Check the state of KVM

```
mca@U40:-$ sudo virsh list --all
Id Name State

1 KVM running
mca@U40:-$
```

Introduction to Containers: Docker installation and deployment

Procedure
Steps for Installing Docker:
Step 1: Open the terminal on Ubuntu.
Step 2: Remove any Docker files that are running in the system, using the following command
☐ Command : \$ sudo apt-get remove docker docker-engine docker.io
After entering the above command, you will need to enter the password of the root and press
enter.
Step 3: Check if the system is up-to-date using the following command:
☐ Command : \$ sudo apt-get update
Step 4: Install Docker using the following command:
☐ Command:\$ sudo apt install docker.io
You'll then get a prompt asking you to choose between y/n – choose 'y'
Step 5: Install all the dependency packages using the following command:
☐ Command :\$ sudo snap install docker
Step 6 : Before testing Docker, check the version installed using the following command:
☐ Command:\$ docker –version
Step 7: Pull an image from the Docker hub using the following command:
☐ Command : \$ sudo docker run hello-world
Here, hello-world is the docker image present on the Docker hub.
Step 8: Check if the docker image has been pulled and is present in your system using the
following command:
☐ Command: \$ sudo docker images
Step 9: To display all the containers pulled, use the following command:
☐ Command : \$ sudo docker ps -a
Step 10: To check for containers in a running state, use the following command:
☐ Command : \$ sudo docker ps
11. Installing and configuring modern frameworks like Laravel typically involves setting up a web server, PHP, a database, and the framework itself. Below is a general guide to

installing and configuring Laravel on a Linux system. Please note that specific steps may vary based on your distribution and environment.
Step 1: Prerequisites
☐ Install Required Software: Make sure you have a web server (e.g., Apache or Nginx),
PHP, Composer (dependency manager), and a database server (e.g., MySQL) installed
on your system.
☐ Install Composer: Download and install Composer by following the instructions on
the official Composer website.
Step 2: Install Laravel
1. Create a New Laravel Project: Open a terminal and navigate to the directory where
you want to create your Laravel project. Run the following command:
□ composer create-projectprefer-dist laravel/laravel myproject
This will create a new Laravel project named "myproject."
Step 3: Configure the Web Server
1. Apache:
☐ Create a new virtual host configuration for your Laravel project in your Apache
configuration.
☐ Set the DocumentRoot to the public directory of your Laravel project.
☐ Enable the necessary Apache modules (e.g., rewrite) and restart Apache.
2. Nginx:
☐ Create a new server block configuration for your Laravel project in your Nginx
configuration.
\square Set the root directive to the public directory of your Laravel project.
☐ Configure the necessary location directives and restart Nginx.
Step 4: Configure Laravel
1. Environment Configuration:
☐ Rename the .env.example file in your Laravel project root to .env.
$\hfill\Box$ Set database connection details, application key, and other settings in the .env
file.
2. Generate Application Key: Run the following command in your Laravel project

directory:
□ php artisan key:generate
3. Run Migrations: If your .env file is configured with database details, run migrations
to create necessary database tables:
□ php artisan migrate
Step 5: Testing the Setup
1. Access the Application: Open a web browser and visit the URL you configured for
your Laravel project. You should see the Laravel welcome page.
2. Create Routes and Views: Begin building your application by defining routes and
creating views in the resources/views directory.
